"Genome sequence of Yersinia pestis, the causative agent of plague."; Nature 413:523-527(2001).

-I- FUNCTION: THIS PROTEIN IS INVOLVED IN THE INITIAL STEP OF IRON UPTAKE BY BINDING HEMIN, AN IRON CHELATIN SIDEROPHORE THAT ALLOWS THE BACTERIA TO EXTRACT THOON FROM THE ENVIRONMENT.

-I- SUBCELLULAR LOCATION: Outer membrane.

-I- SIMILARITY: LOCAL TO OTHER TONB-DEPENDENT RECEPTOR PROTEINS.                                                                                                                                                                                                                                              IS REQUIRED FOR HEME UPTAKE.

IS REQUIRED FOR HEME UPTAKE.

SUBCELLULAR LOCATION: OUTER membrane.

MISCELLANEOUS: THIS PROTEIN IS SUBJECT TO PHASE-VARIABLE EXPRESSION ASSOCIATED WITH ALTERATION IN THE LENGTH OF THE CCAA REPEAT REGION. THIS MECHANISM IS CALLED SLIPPED-STRAND MISPAIRING. ADDITION OR LOSS OF CCAA REPEAT UNITS WOULD CHANGE THE READING FRAME AND RESULT IN INTRODUCTION OF STOP CODONS DOWNSTREAM OF THE REPEAT REGION. THIS MAY BE A MECHANISM OF REGULATION AND A WAY TO AVOID THE IMMUNOLOGICAL RESPONSE OF THE HOST.

SIMILARITY: BELONGS TO THE TONB-DEPENDENT RECEPTOR PROTEIN FAMILY;
                                                                                                                                                                        European Bioinformatics Institute.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -: SUBCELLULAR LOCATION: OLDER membrane.
-: SUBCELLULAR LOCATION: OLDER MEMBRANE.
-: MISCELLANBOUS: THIS PROTEIN IS SUBJECT TO PHASE-VARIABLE
EXPRESSION ASSOCIATED WITH ALTERATION IN THE LENGTH OF THE CCAA
REPEAT REGION. THIS MECHANISM IS CALLED SILPPED-STRAND MISPAIRING.
ADDITION OR LOSS OF CCAA REPEAT UNITS WOULD CHANGE THE READING
FRAME AND RESULT IN INTRODUCTION OF STOP CODONS DOWNSTREAM OF THE
REPEAT REGION. THIS MAY BE A MECHANISM OF TREGULATION AND A
MAY TO AVOID THE IMMUNOLOGICAL RESPONSE OF THE HOST.
-: SIMILARITY: BELONGS TO THE TONB-DEPENDENT RECEPTOR PROTEIN FAMILY;
HENGGLOBIN/PAPTOGLOBIN BINDING PROTEIN SUBPAMILY.
-: CAUTION: THIS IS A CONCEPTUAL TRANSLATION, A FRAMESHIFT WAS
INTRODUCED IN THE REPEATS REGION TO MAXIMIZE THE SIMILARITY
WITH OTHER ORTHOLOGS.
                                                                                                                                                                                                                                                                                                                                                  "Identification of an outer membrane protein involved in utilization
                                                                                                                                                                                                                                                                                                                                                                                                                                      Coudert E.;
Unpublished observations (AUG-2001).
-!- FUNCTION: ACTS AS A RECEPTOR FOR THE HEMOGLOBIN/HAPTOGLOBIN
COMPLEX OF THE HUMAN HOST AND IS REQUIRED FOR HEME UPTAKE. DOES NOT BIND HEMOGLOBIN ALONE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HEMOGLOBIN-HAPTOGLOBIN BINDING PROTEIN

Lett. 161:331-336(1998).

FUNCTION: PRODUCTION OF EXTRACELLULAR GLUCANS, THAT ARE THOUGHT
TO PLAY A KEY ROLE IN THE DEVELOPMENT OF THE DENTAL PLAQUE BECAUSE
OF THEIR ABILITY TO ADHERE TO SMOOTH SURFACES AND MEDIATE THE
AGGREGATION OF BACTERIAL CELLS AND FOOD DEBRIS.
CATALYTIC ACTIVITY: Sucrose + {(1,6)-alpha-D-glucosyl}(N) = D-fructose + {(1,6)-alpha-D-glucosyl}(N+1).
SUBCELLULAR LOCATION: Secreted.
DISEASE: DENTAL CARLES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MISCELLANEOUS: GTF-I SYNTHESIZES WATER-INSOLUBLE GLUCANS (ALPHA 1,3-LINKED GLUCOSE AND SOME 1,6 LINKAGES), GTF-S SYNTHESIZES WATER-SOLUBLE GLUCANS (ALPHA 1,6-GLUCOSE). GTF-SI SYNTHESIZES BOTH FORMS OF GLUCANS.
